

Model evaluation metrics and formulas		
Class Name	Definition	Code Snippet
<code>Classification</code>	<p>Accuracy: The ratio of correctly classified instances to the total number of instances.</p> <p>Precision: The ratio of correctly classified positive instances to the total number of positive instances.</p> <p>Recall: The ratio of correctly classified positive instances to the total number of positive instances.</p> <p>F1 Score: The harmonic mean of precision and recall.</p> <p>Confusion Matrix: A table used to evaluate the performance of a classification model. It shows the number of correct and incorrect predictions for each class.</p>	<pre> from sklearn.metrics import accuracy_score, precision_score, recall_score, f1_score, confusion_matrix # Accuracy accuracy = accuracy_score(y_true, y_pred) # Precision precision = precision_score(y_true, y_pred) # Recall recall = recall_score(y_true, y_pred) # F1 Score f1 = f1_score(y_true, y_pred) # Confusion Matrix cm = confusion_matrix(y_true, y_pred) </pre>
<code>Regression</code>	<p>Mean Squared Error (MSE): The average of the squares of the errors.</p> <p>Root Mean Squared Error (RMSE): The square root of the MSE.</p> <p>Adjusted R-squared: A measure of the goodness of fit of a regression model.</p>	<pre> from sklearn.metrics import mean_squared_error, rmse, adjusted_r2 # MSE mse = mean_squared_error(y_true, y_pred) # RMSE rmse = rmse(y_true, y_pred) # Adjusted R-squared adj_r2 = adjusted_r2(y_true, y_pred) </pre>
<code>Time Series</code>	<p>Mean Absolute Error (MAE): The average of the absolute errors.</p> <p>Mean Squared Error (MSE): The average of the squares of the errors.</p> <p>Root Mean Squared Error (RMSE): The square root of the MSE.</p> <p>Adjusted R-squared: A measure of the goodness of fit of a regression model.</p>	<pre> from sklearn.metrics import mean_absolute_error, mean_squared_error, rmse, adjusted_r2 # MAE mae = mean_absolute_error(y_true, y_pred) # MSE mse = mean_squared_error(y_true, y_pred) # RMSE rmse = rmse(y_true, y_pred) # Adjusted R-squared adj_r2 = adjusted_r2(y_true, y_pred) </pre>
<code>Clustering</code>	<p>Adjusted Rand Index (ARI): A measure of the similarity between two clusterings.</p> <p>Adjusted Mutual Information (AMI): A measure of the similarity between two clusterings.</p> <p>Adjusted Silhouette (AS): A measure of the similarity between two clusterings.</p>	<pre> from sklearn.metrics import adjusted_rand_score, adjusted_mutual_info_score, adjusted_silhouette_score # ARI ari = adjusted_rand_score(y_true, y_pred) # AMI ami = adjusted_mutual_info_score(y_true, y_pred) # AS as = adjusted_silhouette_score(y_true, y_pred) </pre>
<code>Association</code>	<p>Association Rule Mining: A technique for discovering interesting relationships between variables in large databases.</p> <p>Support: The number of transactions that contain the itemset.</p> <p>Confidence: The ratio of the number of transactions that contain the itemset to the number of transactions that contain the antecedent.</p> <p>Lift: The ratio of the confidence of a rule to the product of the individual itemset probabilities.</p>	<pre> from sklearn.metrics import association_rule_mining # Association Rule Mining rules = association_rule_mining(data) # Support support = support(y_true, y_pred) # Confidence confidence = confidence(y_true, y_pred) # Lift lift = lift(y_true, y_pred) </pre>

Validation strategies for model evaluation		
Class Name	Definition	Code Snippet
<code>Validation</code>	<p>Train-Test Split: A technique for splitting the data into training and testing sets.</p> <p>Cross-Validation: A technique for evaluating the performance of a model on multiple subsets of the data.</p> <p>Bootstrap: A technique for generating synthetic data samples.</p> <p>Monte Carlo: A technique for simulating random events.</p>	<pre> from sklearn.model_selection import train_test_split, cross_val_score, bootstrap, monte_carlo # Train-Test Split train, test = train_test_split(data) # Cross-Validation cv_scores = cross_val_score(model, data) # Bootstrap boot_scores = bootstrap(model, data) # Monte Carlo mc_scores = monte_carlo(model, data) </pre>
<code>Model</code>	<p>Model Selection: A technique for choosing the best model from a set of models.</p> <p>Model Evaluation: A technique for evaluating the performance of a model.</p> <p>Model Interpretation: A technique for understanding the model's predictions.</p>	<pre> from sklearn.model_selection import model_selection, model_evaluation, model_interpretation # Model Selection selected_model = model_selection(model) # Model Evaluation evaluated_model = model_evaluation(model) # Model Interpretation interpreted_model = model_interpretation(model) </pre>
<code>Dataset</code>	<p>Dataset Partitioning: A technique for splitting the data into training and testing sets.</p> <p>Dataset Preprocessing: A technique for cleaning and transforming the data.</p> <p>Dataset Feature Selection: A technique for selecting the most relevant features.</p>	<pre> from sklearn.model_selection import dataset_partitioning, dataset_preprocessing, dataset_feature_selection # Dataset Partitioning partitioned_data = dataset_partitioning(data) # Dataset Preprocessing preprocessed_data = dataset_preprocessing(data) # Dataset Feature Selection selected_features = dataset_feature_selection(data) </pre>
<code>Model</code>	<p>Model Training: A technique for training a model on a dataset.</p> <p>Model Deployment: A technique for deploying a model to a production environment.</p> <p>Model Monitoring: A technique for monitoring the performance of a model in production.</p>	<pre> from sklearn.model_selection import model_training, model_deployment, model_monitoring # Model Training trained_model = model_training(model, data) # Model Deployment deployed_model = model_deployment(model) # Model Monitoring monitored_model = model_monitoring(model) </pre>
