Cheat Sheet: Building Supervised Learning Models

Common supervised learning models

Process Name	Brief Description	Code Syntax
ONE VS ONE CLASSIFIER (USING LOGISTIC REGRESSION)	Process: This method trains one classifier for each pair of classes. Key hyperparameters: - "Estimator": Base classifier (e.g., logistic regression) Pros: Can work well for small datasets. Cons: Computationally expensive for large datasets. Coming applications: Multiclass classification problems where the number of classes is relatively small.	<pre>from sklearn.multiclass import OneVsOneClassifier from sklearn.linear_model import LogisticRegression model = OneVsOneClassifier(LogisticRegression())</pre>
ONE VS ALL CLASSIFIER (USING LOGISTIC REGRESSION)	Process: Trains one classifier per class, where each classifier distinguishes between one class and the best. Key hyperparameters: - Estimator: Base classifier (e.g., Logistic Regression) - Multiclass: Strategy of Handle Multiclass classification (ove') Pros: Simpler and more scalable than One vs One. Cons: Less accurate for highly imbalanced classes. Common applications: Common in Multiclass classification problems such as image classification.	from sklearn.multiclass import OneVsRestClassifier from sklearn.linear_model import LogisticRegression model = OneVsRestClassifier(LogisticRegression()) or from sklearn.linear_model import LogisticRegression model_ova = LogisticRegression(multi_class='ovr')
DECISION TREE CLASSIFIER	Process: A Tree-based classifier that splits data into smaller subsets based on feature values. Key hyperparameters: - "MAX_DEPTH: "MAXMUM DEPTH OF THE TREE Pros: Easy to interpret and visualize. Coss: Prons to overhtting if not freuned properly. Common applications: Classification tasks, such as credit risk assessment.	from sklearn.tree import DecisionTreeClassifier model = DecisionTreeClassifier(max_depth=5)
DECISION TREE REGRESSOR	Process: Similar to the decision tree classifier, but used for regression tasks to fredict continuous values. Key hyperparameters: "MAX_DEPTH: "MAXIMUM DEPTH OF THE TREE "Pros: Easy to interpret, handles nonlinear data. Coms: Can overfit and perform profily on nonly data. Common applications: Regression tasks, such as predicting housing prices.	from sklearn.tree import DecisionTreeRegressor model = DecisionTreeRegressor(max_depth=5)
LINEAR SVM CLASSIFIER	Process: A Linear Classifier that finds the optimal hyperplane separating classes with a mainline marginetes: "C": Regularization nrameter "C": Regulariza	from sklearn.svm import SVC model = SVC(kernel='linear', C=1.0)
K-NEAREST NEIGHBORS CLASSIFIER	Process: CLASSIFIES DATA BASED ON THE MAJORITY CLASS OF ITS NEAREST NEIGHBORS. Key hyperparameters: "N. NIGHORS' NAMBER OF NEIGHBORS TO USE "WEIGHT PUNCTION USED IN PREDICTION (UNIFORM OR "DISTANCE") "ALGORITHM'. ALGORITHM USED TO COMPUTE THE NEAREST NEIGHBORS (AUTO , "BALL_TREE", "KD_TREE", "BRUTE") Pros: SIMPLE AND EFFECTIVE FOR SMALL DATASETS. COMS: COMPUTATIONALLY EXPENSIVE AS THE DATASET GROWS. COMMON applications: RECOMMENDATION SYSTEMS, IMAGE RECOGNITION.	from sklearn.neighbors import KNeighborsClassifier model = KNeighborsClassifier(n_neighbors=5, weights='uniform')
RANDOM FOREST REGRESSOR	Process: An ensemble method using multiple decision trees to improve accuracy and reduce overfitting. Key hyperparameters: - N_estimators: Number of trees in the forest - N_estimators: Number of trees in the forest - NA_estimators: Number of trees - NA_Estimators: Number of trees - Comes Model Complexity increases with the sumber of trees Common applications: Regression tanks such as predicting sales or stock prices.	from sklearn.ensemble import RandomForestRegressor model = RandomForestRegressor(n_estimators=100, max_depth=5)
XGBoost regressor	Process: A Gradient boosting method that builds trees sequentially to correct errors from previous trees. Key hyperparameters: - N_ estimators: Number of boosting rounds - NLESTIMATORS: NUMBER OF BOOSTING ROUNDS - NLEARING, ARTE: STEP SIZE TO IMPROVE ACCUBACY - MAX_DEPTH: MAXIMUM DEPTH OF EACH TREE Pros: High accuract van Dwords well- with labbe datasets. Cors: Computationally intensive, complex to tune. Common applications: Predictive modeling, especially in Kaggle competitions.	import xgboost as xgb model = xgb.XGBRegressor(n_estimators=100, learning_rate=0.1, max_depth=5)

Associated functions used

Method Name	Brief Description	Code Syntax
OneHotEncoder	Transforms categorical features into a one-hot encoded matrix.	<pre>from sklearn.preprocessing import OneHotEncoder encoder = OneHotEncoder(sparse=False) encoded_data = encoder.fit_transform(categorical_data)</pre>
ACCURACY_SCORE	COMPUTES THE ACCURACY OF A CLASSIFIER BY COMPARING PREDICTED AND TRUE LABELS.	from sklearn.metrics import accuracy_score accuracy = accuracy_score(y_true, y_pred)
LABELENCODER	ENCODES LABELS (TARGET VARIABLE) INTO NUMERIC FORMAT.	<pre>from sklearn.preprocessing import LabelEncoder encoder = LabelEncoder() encoded_labels = encoder.fit_transform(labels)</pre>
PLOT_TREE	PLOTS A DECISION TREE MODEL FOR VISUALIZATION.	from sklearn.tree import plot_tree plot_tree(model, max_depth=3, filled=True)
NORMALIZE	SCALES EACH FEATURE TO HAVE ZERO MEAN AND UNIT VARIANCE (STANDARDIZATION).	from sklearn.preprocessing import normalize normalized_data = normalize(data, norm='l2')
COMPUTE_SAMPLE_WEIGHT	COMPUTES SAMPLE WEIGHTS FOR IMBALANCED DATASETS.	from sklearn.utils.class_weight import compute_sample_weight weights = compute_sample_weight(class_weight='balanced', y=y)
ROC_AUC_SCORE	COMPUTES THE AREA UNDER THE RECEIVER OPERATING CHARACTERISTIC CURVE (AUC-ROC) FOR BINARY CLASSIFICATION MODELS.	from sklearn.metrics import roc_auc_score auc = roc_auc_score(y_true, y_score)
